OUR 4 PILLARS FOR RESPONSIBLE DISTILLING

Our distillery is located on the remote Ardnamurchan peninsula, the most westerly point of mainland Britain. Our environment is a place of extreme natural beauty; as responsible distillers we want to preserve this by having the lightest possible impact. Whisky is a natural product and we've been careful to reflect our connection to the surrounding nature in the way we produce our spirit.

Powered by 100% Renewable Energy

Our distillery utilises our natural environment to provide all our energy needs. We have solar panels on the roofs of our warehouses and harness hydropower from the same stream running off the hills behind the distillery that provides cooling water for our production process.

01

Sustainable Forestry & Biomass

We produce clean energy to power our stills by using locally planted forestry from fewer than two miles from our distillery. The forestry site has a detailed 100-year plan to re-plant only with tree species native to the Ardnamurchan peninsula.

02

Utilising Our Waste Products

Two of the main waste products from production are the draff (used barley) and liquid by-product from distillation. We combine these to produce cattle feed pellets for the local animals on the peninsula.

03

Environmentally Conscious Packaging

We are always looking to reduce or eliminate unnecessary packaging where we can. Our whisky sells without a gift box and our clear glass bottles are made using 57% recycled glass.
